SQL - CREATE TABLE Statement

A Table is a combination of rows and columns. For creating a table we have to define the structure of a table by adding names to columns and providing data type and size of data to be stored in columns.

Syntax :

CREATE TABLE table_name (

     column1 datatype,

     column2 datatype,

     column3 datatype,

     .....

     columnN datatype

 );

Example 1 :

CREATE TABLE customers(

     id INT,

     name VARCHAR(20),

     age INT,

     address CHAR (25),

     salary DECIMAL (18, 2)

);
